Before You Start

This program is aimed at developers with 1-2 years of experience programming in Java or another object-oriented programming language like Python or C#. If you don't have this experience, we recommend you first complete our Android Basics Nanodegree program or its individual classes prior to starting this program.

Experience with git and GitHub is highly recommended. If you don't have this experience, please take our free course on using git and GitHub prior to starting this Nanodegree program. In addition, taking our free course “GitHub & Collaboration” would also be beneficial to you.

Support Options

We are here to support you every step of the way.

The Study Group feature found in the Udacity classroom helps student, like you, connect with their peers, mentors, and project reviewers. Students can also seek help, network, and collaborate with their classmates throughout their program!

The Knowledge platform helps students engage with their peers & mentors, ask and answer questions, and overcome learning roadblocks quickly.

While going through the program if students experience any issues or have questions regarding our product offerings we encourage them to send us an e-mail at and-support@udacity.com
Term 1

Project 1: Sandwich Club App

In this project, you will complete an app by building a layout and populating its fields from data received as JSON.

Supporting Learning Content

<table>

<tbody>
<tr>
<td>CREATE PROJECT SUNSHINE</td>
<td>➔ Create and configure a new project in Android Studio using mock data</td>
</tr>
<tr>
<td>CONNECT TO THE INTERNET</td>
<td>➔ Connect your project to the cloud and replace mock data with data from a weather service, using Android permissions and network I/O</td>
</tr>
</tbody>
</table>

Project 2: Popular Movies App, Stage 1

Build a simple movies app that communicates with the Internet and provides a responsive user experience. In this project, you will:

- Fetch data from the Internet using the Movie Database API.
- Use adapters and custom list layouts to populate list views.
- Incorporate libraries to simplify the amount of code you need to write

<tbody>
<tr>
<td>RECYCLERVIEW</td>
<td>➔ Display and interact with scrolling information using a Recyclerview, and update your app to display information in</td>
</tr>
</tbody>
</table>
### Project 3: Popular Movies App, Stage 2

Build off of your existing movies app to create a fully featured application that looks and feels natural on the latest stable Android operating system (Android version Oreo, as of August 2017). In this project, you will:

- Allow users to view and play trailers (either in the YouTube app or a web browser).
- Allow users to read reviews of a selected movie.
- Allow users to mark a movie as a favorite in the details view by tapping a button (star).
- Create a database and content provider to store the names and IDs of the user's favorite movies (and optionally, the rest of the information needed to display their favorites collection while offline).
- Modify the existing sorting criteria for the main view to include an additional pivot to show their favorites collection.

<tr>
<td>CONTENT PROVIDERS</td>
<td>➔ Use a pre-existing content provider in your app to grab</td>
</tr>
</tbody>
</table>
user data from your user's phone

**ANDROID ARCHITECTURE COMPONENTS**

- Learn how Android Architecture components classes can help manage your application’s lifecycle and its data persistence needs

**BACKGROUND TASKS**

- Learn how to effectively run jobs in the background, create notifications, and periodically schedule long running background processes

**COMPLETING THE UI**

- Try different views, viewgroups and alternative layouts, perform data binding, make your app accessible

**POLISHING THE UI**

- Add visual polish and styling to your app, including custom colors, fonts and styles, accounting for multiple devices

---

**Project 4: Baking App**

In this project, you will create an app to view cooking recipes. You will handle media loading, verify your user interfaces with UI tests, integrate third party libraries and provide a complete UX with home screen widget.

In this project, you will:
- Use MediaPlayer/ExoPlayer to display videos.
- Handle error cases in Android.
- Add a widget to your app experience.
- Leverage a third-party library in your app.
- Use Fragments to create a responsive design that works on phones and tablets.

---

<tbody>
<tr>
<td>FRAGMENTS</td>
<td>Make reusable components in your app to support different form factors</td>
</tr>
<tr>
<td>LIBRARIES</td>
<td>Use external libraries to personalize your app</td>
</tr>
</tbody>
</table>
Term 2

Project 1: Build It Bigger

In this project, you will use Gradle to build a joke-telling app, factoring functionality into libraries and flavors to keep the build simple. You will configure a library to connect to a web service for jokes. The finished app will consist of four modules:

1. A Java library that provides jokes
2. A Google Cloud Endpoints (GCE) project that serves those jokes
3. An Android Library containing an activity for displaying jokes
4. An Android app that fetches jokes from a web service and passes them to the Android Library for display

</thead>
<tbody>
<tr>
<td>GRADLE FUNDAMENTALS</td>
<td>➔ Learn the basics of Gradle and Gradle build scripts</td>
</tr>
</tbody>
</table>
GRADLE FOR JAVA ➔ Use Gradle to build Java projects

GRADLE FOR ANDROID ➔ Use Gradle with Android Studio, and create free and paid versions of an app

ADVANCED ANDROID BUILDS ➔ Use Gradle to automate tasks, including dependency management and unit testing.

SPECIAL TOPICS ➔ Update old projects and libraries, learn more about custom tasks

Project 2: Make Your App Material
In this project, you will update the look and feel of an app to meet Material Design specifications.

Supporting Lesson Content

<table>
<thead>
<tr>
<th>Lesson Title</th>
<th>Learning Outcomes</th>
</tr>
</thead>
<tbody>
<tr>
<td>ANDROID DESIGN FUNDAMENTALS</td>
<td>➔ Build a layout using Material Design principles</td>
</tr>
<tr>
<td>SURFACES</td>
<td>➔ Implement paper surfaces in your design</td>
</tr>
<tr>
<td>BOLD GRAPHIC DESIGN</td>
<td>➔ Use design elements of space, color, type and imagery to make your app more beautiful and impactful</td>
</tr>
<tr>
<td>MEANINGFUL MOTION</td>
<td>➔ Apply real world principles of motion to make your interface more understandable and continuous</td>
</tr>
<tr>
<td>ADAPTIVE DESIGN</td>
<td>➔ Implement Material Design for new form factors</td>
</tr>
<tr>
<td>CONSTRAINT LAYOUT</td>
<td>➔ Learn and apply the new features of ConstraintLayout that will help you create performant user interfaces</td>
</tr>
</tbody>
</table>
Project 3: Capstone, Stage 1

In this project, you will demonstrate the ability to communicate an app idea formally, using:

- An app description
- UI flow mocks, similar to what you have seen in other Nanodegree projects, like the Popular Movies overview
- A list of required tasks that you will complete to build the app

The Capstone project will give you the experience you need to own the full development of an app. This first stage replicates the design and planning experience that proficient Android Developers are expected to demonstrate.

Supporting Lesson Content

Students will rely on skills acquired from all previous lessons to complete this project.

Project 4: Capstone, Stage 2

In this project, you will demonstrate the skills you have learned in your Nanodegree program journey and apply them to creating a unique app experience of your own. By the end of this project, you will have an app that you can submit to the Google Play Store for distribution.

The Capstone project will give you the experience you need to own the full development cycle of an app.

Supporting Lesson Content

Students will rely on skills acquired from all previous lessons to complete this project.
